                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an isolated polynucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for aldo-keto reductase family 1, member B1 (AKRIB1) gene or its fragment, having the 22214 base pair sequence given in ABL01105. AKRIB1 has antidiabetic activity and can be used in gene therapy. AKRIB1 can be used in the treatment of diabetes. The human AKRIB1 gene is located on chromosome 7935. ABL01107 to ABL01129 represent allele-specific oligonucleotide (ASO) probes used in the detection of polymorphisms in the human AKRIB1 gene; BBL01130 to ABL01175 represent ASO primers used in the detection of polymorphisms in the human AKRIB1 gene; and ABL01176 to ABL01221 represent preferred primers used in the detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; aldo-keto reductase family 1 member B1; aldose reductase; AKR1B1; chromosome 7q35; detection; polymorphism; ASO; probe; pri allele-specific oligonucleotide; antidiabetic; gene therapy; dial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ABL01146;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-MAR-2002

The data about the GPR4 polymucleotides and polypeptides and the polymorphisms associated with them are useful for haplotyping at the GPR4 locus. Allele-specific oligonucleotide (ASO) is useful as probes and primers for assaying a polymorphism in GPR4 gene. The present sequence is an ASO primer used to detect human GPR4 gene polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Haplotyping, (H1), the individual, comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2002-097579/13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bentivegna

The PFKFB2 of the invention has cytostatic and antidiabetic activity. The polymucleotides may have a use in gene therapy. The identified candidate agents targeting PFKFB2, are useful for treating cancer and diabetes. The methods of the invention are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with PFKFB2 activity. The present sequence represents a allele specific oligonucleotide (ASO) probe used in the invention to detect PFKFB2 gene
The present invention describes an isolated polynucleotide (I) having a sequence (S1) comprising soluble carrier family 18 (vesicular monoamine), member 2 (SLC18A2) isogene selected from 49 isogenes with regions of a sequence (SS) of 40023 bp (see ABL51954), and defined by a corresponding set of polymorphisms whose locations and identities are given in the specification; or a sequence (S2) complementary to (S1). (I) has antiinflammatory and neuroleptic activities, and can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 15 BP; 2 A; 1 C; 9

Methods from the present invention can be used for haplotyping and genotyping the SLC18A2 gene in an individual. SLC18A2 is also known as the vesicular monoamine transporter (VMAT2). (1) is useful in studying the expression and function of SLC18A2, and in expressing the SLC18A2 protein for use in screening for candidate drugs to treat diseases related to SLC18A2 activity and in studying the effect of the variation on the biological activity of SLC18A2 as well as on the binding affinity of candidate drugs targeting SLC18A2 for the treatment of respiratory inflammatory diseases such as neuropsychiatric disorders involving monoaminergic brain systems. The present sequence represents an allele specific oligonucleotide (ASO) primer for human SLC18A2, which is given
                          The invention relates to an isolated polypeptide comprising a sequence which is a polymorphic variant of a reference sequence for the amyloid beta precursor protein binding protein 1, 59kD (APPBP1) protein or its fragment. The polymorphic variants are useful in studying the expression and function of APPBP1, in expressing APPBP1 protein for use in screening for candidate drugs to treat diseases related to APPBP1 activity, in studying the effect of the variation on the biological activity of APPBP1, and the binding affinity of candidate drugs targeting APPBP1 for the treatment of disorders such as Alzheimer's disease. The haplotyping methods are useful in validating APPBP1 as a candidate target for treating a specific condition or disease predicted to be associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; amyloid beta precursor protein binding protein 1; APPBP1; probe; Alzheimer's disease; transgenic animal; platelet aggregation; single nucleotide polymorphism; SNP; allele-specific oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
      treating a specific APPBP1 activity, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amyloid beta precursor protein binding protein 159 kD (APPBP1) gene polymorphic variants, useful e.g. in studying the expression and function of APPBP1 and screening candidate drugs for treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human APPBP1 gene, allele-specific oligonucleotide

The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRM5) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its confidence. The invention is useful in drug screening assays. The molecules of the invention are useful in studying the expression and function of chrys, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the convention are useful in developing diagnostic tests and therapeutic condidate drugs for treating specific condition or disease associated condidate drugs for treating specific condition or disease associated considered the haplotypes or one of the haplotype pairs. The invention is useful in determining whether an individual custoful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genotyping and/or haplotyping condition or disease associated useful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genotyping and/or haplotyping condition of the haplotyping and/or haploty
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The transgenic animals are useful for studying expression the APPBP1 isogenes in vivo, for in vivo screening and testing of dr targeted against APPBP1 protein, and for testing the efficacy of therapeutic agents and compounds for disorders related to platelet aggregation in a biological system. ABX2771-ABX3227 represent huma APPBP1 gene allele-specific oligonucleotides used in the method of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human CHRM5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        13-AUG-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABK81778;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                         CC (CHRM5) polynucleotide comprising a sequence which is a polymorphic comprising a sequence which is a polymorphic comprising a sequence which is a polymorphic comprising a sequence for the CHRM5 gene or its fragment, or a CC polymorphic variant for a reference sequence for the CHRM5 cDNA or its fragment. The invention is useful in drug screening assays. The molecules CC fragment. The invention is useful in drug screening assays. The molecules CC cHRM5, and in expressing CHRM5 protein for use in screening for candidate CC drugs to treat diseases related to CHRM5 activity. The methods of the CHRM5 protein for use in screening for candidate composed to treat diseases related to CHRM5 activity. The methods of the CC candidate drugs for treating specific condition or disease associated composed to the CHRM5 activity and is useful in the design of clinical trials of CC candidate drugs for treating specific condition or disease associated composed the CHRM5 activity and is useful in determining whether an individual CC with CHRM5 activity and is useful in genctype pairs. The invention is useful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genctyping and/or haplocyping the CRRM5 gene in an individual The present nucleic acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            represents one of a collection of allele-specific primers (ABK81775-ABK81794) that were used in the polymorphisms in the human CHRM5 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 15 BP; 2

                                                                                                            fragment. The invention is useful in drug screening assays. The molecules of the invention are useful in studying the expression and function of CHRM5, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the invention are useful in developing diagnostic tests and therapeutic treatments. The method is also useful in the design of clinical trials of candidate drugs for treating specific condition or disease associated with CHRM5 activity and is useful in determining whether an individual has one of the haplotypes or one of the haplotype pairs. The invention is useful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genetyping and/or haplotyping the CHRM5 gene in an individual. The present nucleic acid sequence represents one of a collection of allele-specific oligonucleotide (ASO) primers (ABK81795-ABK81794) that were used in the invention to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel cholinergic receptor, muscarinic 5 polynucleotide useful therapeutically and in screening for candidate drug to treat diseases related to the receptor activity.
                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a new cholinergic receptor, muscarinic (CHRMS) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRMS gene or its fragment, or polymorphic variant of a reference sequence for a CHRMS cDNA or its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2002-435523/46
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cholinergic receptor muscarinic 5; CHRM5; genotyping; haplotyping; single nucleotide polymorphism; SNP; allele-specific oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human CHRM5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           13-AUG-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABK81777 standard; DNA; 15

The majority of PWS/Angelman patients are deleted for a common set of markers including ML34, IR4-3R, TD189-1 and TD3-21.
                                                                                                                                                                                                                                                                                                Sequence 35 BP; 5 A; 9 C; 8 G; 5 T; 0 U; 8 Other;

GASC1 has been located to the p23-24 region of human chromosome 9. GASC1 can be used in the diagnosis and investigation of diseases with which cell differentiation and proliferation are associated, such as cancer. It can also be used in gene therapy of these diseases, and screening substances for their ability to modify the expression of GASC1 and for use as drugs. The present sequence represents a PCR primer for human GASC1, which is used in an example from the

The novel method is useful for estimating the disease risk or prognosis of an individual or for estimating a treatment response of an individual suffering from cancer to a disease treatment. This polynucleotide sequence represents a probe used for detecting single nucleotide polymorphisms in the DNA of human chromosome 19 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 prognosis of an individual by sequence polymorphism analysis, especially polymorphisms in the human chromosome 19g. The invention further relates to: estimating a treatment response of an individual suffering from cancer to a disease treatment; a primer or probe for use in the method of estimating the disease risk or prognosis of an individual or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               07-OCT-2002; 2002DK-00001500

                                                                                                                                                                                                                                             문
                                                                                                                                                                                                                                                                                                                                                                                                     CC variety of detection assays, including hybridisation assays, nucleid acid cc arrays and PCR-based methods. The invention also encompasses methods of cevaluating and screening drugs using genetic polymorphism data. Genetic CC polymorphism data, particularly that relating to single nucleotide CC polymorphisms (SNPs), may be used in studying the relationship between CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases, conditions, and responses to CC frequently, and have lower mutation rates than other genome variations CC such as repeating sequences. The detection and analysis of polymorphisms CC such as repeating sequences. The detection and analysis of polymorphisms CC frig therapies based upon the genetic profile of individual patients. CC greatest therapeutic effect for a particular patient, but would also CC reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and CC approval processes. For example, individuals tould be selected for CC posable of responding to a particular drug or drug class, and previously capacitions, failed drug canaly if their genetic profiles indicate that they are capacitions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different constaints apatient needs to take before finding an effective therapy.
                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27-DEC-2000; 2000JP-00399443

CC encoding enzymes associated with drug metabolism. The invention relates ct omethods and compositions for identifying individuals who have at least cone polymorphisms in such drug metabolising enzyme-encoding genes. The cplymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABS43217-ABS50887 using a crariety of detection assays, including hybridisation assays, nucleic acid arrays and pCR-based methods. The invention also encompasses methods of cevaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide colonymorphism (aNPs), may be used in studying the relationship between CC polymorphism (aNPs), may be used in studying the relationship between CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases, conditions, and responses to CC drugs. SNPs are also useful as polymorphism markers for discovering genes creation are particularly useful contractions are particularly useful contractions are particularly useful contractions are repeated as they are stable in populations, occur that cause or exacerbate certain diseases. SNPs are particularly useful contraction as repeating sequences. The detection and analysis of polymorphisms compasses ancoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients. CC drug therapies based upon the guesswork out of selecting the drug with the cc greatest therapeutic effect for a particular patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. CC approval processes. For example, individuals could be selected for approval processes. For example, individuals could be selected for approval trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously considered the patients are on medication and the number of different medicat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; drug metabolising enzyme; gene; drug metabolism; chromosome 22; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; polymorphism; SNP; ds. clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     meprin A beta protein; aminopeptidase P-like protein; XPN-PEPL; tissue kallikrein protein; KLKL; aminopeptidase p protein; MEPIB; tissue kallikrein protein; KLKL; aminopeptidase p protein; MEPIB; soluble guanylate cyclase 1 alpha-2 subunit protein; GUCYIA2; haploty; angioedema; angioedema-like disorder; paternity testing; cardiovascular disease; angina pectoris; hypertension; heart failure myocardial infarction; aneurysm; stroke; embolism; thrombosis; coronary artery disease; arteriosclerosis; hypersensitivity; haemodialysis; sepsis; inflammatory disease; inflammatory arthritis; asthma; chronic obstructive pulmonary disease; cough reflex; allergy;
                                          The invention relates to an isolated nucleic acid (1) derived from a human gene encoding a protein, such as the C1, S subcomponent protein (C1S), the alanyl aminopeptidase protein (ANPED), the meprin A, beta protein (MREP1B), the aminopeptidase P-like protein (XPN-PBPL), the tissue kallikrein protein (KLK1), the membrane bound aminopeptidase P protein (XPN-PBP2), or the soluble guanylate cyclase 1, alpha-2 subunit protein (XPN-PBP2). The nucleic acid comprises at least one polymorphic position, including the alleles, reference alleles and alternate alleles of the single nucleotide polymorphisms, listed in the specification. The
                                                                                                                                                                                                                              New nucleic acid comprising a single nucleotide polymorphism at a specific location, useful in paternity testing, genetic analysis diagnosing, preventing or treating cardiovascular diseases e.g. angioedema or angina pectoris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ss; human; single nucleotide polymorphism;

```
CC product of the gene. The polymorphic position residing in a non-coding CC position resides within the untranslated region or an intronic region of the gene. Constructing haplotypes using the nucleic acids above further CC comprises using the haplotypes to identify an individual for the presence of a disease phenotype, and correlating the presence of the disease (CC phenotype with the haplotype. The disease phenotype is angioedema or an CC angioedema-like disorder. The nucleic acids, primers and probes are CC useful in phenotype correlations, paternity testing, medicine and genetic CC analysis. The nucleic acids and polypeptides can be used in diagnosing, CC preventing or treating cardiovascular diseases, e.g. angioedema, angina CC pectoris, hypertension, heart failure, myocardial infarction, aneurysm, CC arteriosclerosis, thrombosis, coronary artery disease or sepsis, inflammatory diseases, inflammatory arthritis, asthma, chronic cobstructive pulmonary diseases, inflammatory arthritis, asthma, chronic constructive pulmonary diseases, inflammatory arthritis, asthma, chronic constructive pulmonary diseases, cough reflex, allergies, or cancer. The present sequence represents a human single nucleotide polymorphism (SNP)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC protein (MEPIB), the aminopeptidase P-like protein (XPN-PEPI), the tissue CC kallikrein protein (KLK1), the membrane bound aminopeptidase P protein CC (XPNPEP2), or the soluble guanylate cyclase 1, alpha-2 subunit protein CC (XPNPEP2). The nucleic acid comprises at least one polymorphic position. CC including the alleles, reference alleles and alternate alleles of the cc single nucleotide polymorphisms, listed in the specification. The CC single nucleotide polymorphisms, listed in the specification within the genomic CC sequence of the gene. The polymorphic position residing in a coding cooling position resides within the untranslated region of the translated CC product of the gene. The polymorphic position residing in a non-coding constition resides within the untranslated region of an intronic region of the gene. Constructing haplotypes using the nucleic acids above further CC comprises using the haplotypes to identify an individual for the presence of a disease phenotype, and correlating the presence of the disease phenotype with the haplotypes to identify an individual for the presence co f angioedema-like disorder. The nucleic acids, primers and probes are cc useful in phenotype correlations, paternity testing, medicine and genetic analysis. The mucleic acids and polypeptides can be used in diagnosing, cc preventing or treating cardiovascular diseases, e.g. angioedema angina could prove the could be acids and polypering the presence or arteriosclerosis, hypersensitivity reactions during haemodialysis. Constructive pulmonary disease, inflammatory arthritis, asthma, chronic constructive pulmonary disease, and protective pulmonary disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

AAM53124 to AAM53229 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AA173060 to AA179867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30-NOV-1999; 99US-0168138P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated
AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to munan polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; single nucleotide polymorphism; SNP; genome; protein therapy; vaccine; probe; diagnostic assay; quantitation; restorative therapy; polymorphic; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polyperides.
Sequence 16
                            genetic characterisation, of acquired disease allel
                                       AAQ95282 and AAQ95283 are a primer pair for the PCR amplification of the simple tandem repeat (STR) corresponding to wg2g4. The STR can be used for treatment and diagnosis in human and veterinary medicine, partic. I genetic characterisation, mapping, linkage studies and analysis/diagnosis for the statement and diagnosis of the statement and diagnosis.
                                                                                                                                           Identifying simple tandem repeat loci in DNA - by screening DNA library to enrich for fragments contg. the repeats before cloning and rescreening, also simple tandem repeats for treatment or diagnosis.
                                                                                                                                                                                                        WPI;

                                                                                                                                                                    gene comprises the template. Gene structure can be determined without the need to sequence the entire gene. The method provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the gene or fragment. The methods are useful in germline sequence variation analysis. The method is also useful for determining the boundaries between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing group I type introns such as Tetrahymena rRNA, where self-splicing occurs in the presence of guanosine cofactor. The present sequence is a primer used for sequencing human CYP450 2C19 cDNA related to the invention
                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for determining gene structure when the genomic sequence is unknown. The method involves sequencing the gene across exon-intron boundaries using evenly spaced primers or tiled primers comprises nucleic acids that hybridise to the known cDNA sequence of the gene at about 100-300 base intervals and the comprises of comprises to the comprise of the gene at about 100-300 base intervals and the comprises.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining structure of genes whose sequence is not known from cDNA, sequencing the gene or gene across exon-intron boundaries using evenly spaced primers comprising nucleic acids that hybridize to the cDNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; gene structure; phenotypic expression; guanosine cofactor; germline variation analysis; exon-intron boundary; Tetrahymena rRNA; cytochrome P450 2C19; CYP450 2C19; primer; ss.

The present invention describes a molecular sub-typing system (S) for CC Escherichia coli, which comprises observing and recording variable number CC tandem repeats (VNTR) repeat arrays in an E. coli DNA sample. Also CC described: (I) VNTR loci (I) for sub-typing E. coli O.57:H7; (2) primers CC (II) for amplifying (I); (3) amplicon comprising (I) and a locus comprising a VNTR sequence from E. coli O.57:H7; (4) multiplex cocktails CC (III) for multiplex amplification of (I) comprising (II) and a locus cof (II); (5) kits for molecular sub-typing of E. coli O.57:H7 by PCR CC maintaining hybridisation and amplification condition in a PCR instrument CC with DNA from an E. coli strain; (6) kits for molecular sub-typing of E. coli O.57:H7 by PCR CC maintaining hybridisation and amplification condition in a PCR instrument with DNA from an E. coli o.57:H7 strain; and (7) sub creates for maintaining hybridisation and amplification condition in a coli o.57:H7 strain; (b) obtaining sing: (a) obtaining one or more conservable indicator; (b) obtaining single-stranded sample DNA from the C. coli sample to be subtyped; (c) combining the primers and the VNTR; (d) separated ampliforns; and (f) comparising the primers and the VNTR; (d) separated ampliforns; and (f) comparing the primers and the VNTR; (d) separated ampliforns; and (f) comparing the primers and staces of comprisions obtained by PCR from a known E. coli strain. M1 is useful for coli. The present sequence represents an E. coli VNTR loci related coli. In the present sequence represents an E. coli VNTR loci related convertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               molecular sub-typing system; Escherichia coli; variable number tandem repeat; VNTR; genetic data;

The present invention describes a molecular sub-typing system (S) for CC Escherichia coli, which comprises observing and recording variable number trandem repeats (NWTR) repeat arrays in an E. coli DNA sample. Also CC described: (I) WYTR loci (I) for sub-typing E. coli DNA sample. Also CC (II) for amplifying (I); (3) amplicon comprising (II) and a locus CC (III) for amplifying (I); (3) amplicon comprising (II) and a locus CC (III) for multiplex amplification of (I) comprising two or more primers CC (III); (5) kits for molecular sub-typing of E. coli O157:H7 by PCR CC comprising primers for WNTR loci in E. coli, and amplifying reagents for CC (III); (5) kits for wolecular sub-typing of E. coli O157:H7 by PCR CC (III); (5) kits for molecular sub-typing of E. (C) coli O157:H7 strains by multiplex, comprising (III), and amplifying reagents for maintaining hybridisation and amplification condition in a CC multiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub CC (III); (A) maintaining hybridisation and amplification condition in a cobservable indicator; (b) obtaining single-stranded sample DNA from the CC (III); (B) and amplifying cone or more CC (III); (B) comparising (III); (B) the sample DNA from the CC (III); (B) comparising the primers have an PCR instrument to form amplicons comprising the primers and the VNTR; (d) separated amplicons; and (f) comparing the evaluation to an evaluation of amplicons obtained by PCR from a known E. coli strain. M1 is useful for coli. The present sequence represents an E. coli VNTR loci related coli. In the present sequence represents an E. coli VNTR loci related coli. In the present sequence represents an E. coli vNTR loci related coli. In the present sequence represents an E. coli VNTR loci related coli. In the present coli. (II) is useful for subtyping pathogenic E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADD28839 standard; DNA; 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Molecular sub-typing system for Escherichia coli, comprises observing and recording variable number tandem repeat arrays in an Escherichia coli DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               variable number tandem repeat; VNTR; genetic data; epidemiological database; research; gene; ds.

        CC Escherichia coli, which comprises observing and recording variable number CC tandem repeats (NNTR) repeat arrays in an E. coli DNA sample. Also Cd described: (1) VNTR loci [1] for sub-typing E. coli O157:H7; (2) primers CC (III) for amplifying (1); (3) amplicon comprising (II) and a locus CC (III) for amplifying (1); (3) amplicon comprising (II) and a locus CC (III) for multiplex amplification of (1) comprising two or more primers CC (III); (5) kits for molecular sub-typing of E. coli O157:H7 by PCR CC (III); (6) kits for wolecular sub-typing of E. coli O157:H7 by PCR CC (III); (7) kits for molecular sub-typing of E. coli O157:H7 by PCR CC (III); (8) kits for molecular sub-typing of E. (1) comprising trimers for maintaining hybridisation condition in a PCR instrument CC with DNA from an E. coli strain; (6) kits for molecular sub-typing of E. (1) O157:H7 strains by multiplex, comprising (III), and amplifying creagents for maintaining hybridisation and amplifying one or more creating the instrument with DNA from an E. coli O157:H7 strain; and (7) sub cultiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub cultiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub cultiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub cultiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub cultiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub cultiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub cultiplex instrument by brain; comprising the primers have an conservable indicator; (b) obtaining single-stranded sample DNA from the coli sample to be subtyped; (c) combining the primers, the sample DNA from the coli sample DNA from the primers and the VNTR; (d) separated amplicons and (f) comparing the evaluation to an evaluation of amplicons by size; (e) evaluating numbers and the VNTR; (d) separated amplicons; and (f) comparing the evaluation to an evaluation of instrument of the present subtyping pathogenic E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Molecular sub-typing system for Escherichia coli, comprises observing recording variable number tandem repeat arrays in an Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADD28836 standard;

typing (M1) an E. coli strain, comprising: (a) obtaining one or more primers for amplifying loci comprising: (a) obtaining one or more observable indicator; (b) obtaining single-stranded sample DNA from the E. coli sample to be subtyped; (c) combining the primers, the sample DNA and amplifying reagents under hybridising and amplifying conditions in a PCR instrument to form amplicons comprising the primers and the VNTR; (d) separated amplicons; and (f) comparing the evaluation to an evaluation of amplicons obtained by PCR from a known E. coli strain. M1 is useful for
                                                                                                                                                                                                                     Sequence 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              molecular sub-typing system; Escherichia coli; variable number tandem repeat; VNTR; genetic data; epidemiological database; research; gene; ds.

The prognose sequence is an optineurin promoter motif, repeat element or putative regulatory region.
                             The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism obtained from a cell or bodily fluid (comprising detecting a polymorphism in a promoter region of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, detecting DNA, determining the presence or increased susceptibility to glaucoma or to a progressive ocular hypertensive disorder resulting in loss of visual field in a patient (or the severity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       promoter and amplifying the DNA) and detecting a polymorphism (co obtaining a sample containing human genomic DNA, providing a nucl capable of detecting a SNP located within an optineurin promoter,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09-OCT-2003.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           glaucoma

The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 16
                        The present invention discloses a method for generating five prime biase invaled tag libraries of cDNAs. The step involves isolating a sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the concatenated tags. The present sequence is human NADH dehydrogenase (ubiquinone) Fe-S protein 8 (NADH-coenzyme Q reductase; NDUFS8) tandem tag DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         putative regulatory region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present sequence is an optineurin promoter motif, repeat element

                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 16 BP; 5 A; 6 C; 1 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention discloses a method for generating five prime biased tandem tag libraries of cDNAs. The step involves isolating a sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the concatenated tags.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tandem tag; concatenated tag;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAD63093;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention discloses a method for generating five prime bias tandem tag libraries of cDNAs. The step involves isolating a sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the concatenated tags.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            concatenated tags.

Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic

```
cc the sample. The genomic nucleic acid is contained in a fixed tissue or a ccell, and the sample is metaphase spreads, interphase nucleic or nucleic cell, and the sample is metaphase spreads, interphase nucleic or nucleic contained in paraffin embedded tissue material or frozen tissue sections. The cc found in paraffin embedded tissue material or frozen tissue sections. The cc probe is also useful in comparing a sample of genomic nucleic acid with the metaphase treating a sample of genomic nucleic acid and control genomic nucleic acid, which are differentially labelled, the cc array or both the sample and control genomic nucleic acid and the array control genomic nucleic acid and the array or both the sample and control genomic nucleic acid and the array or both the sample and control genomic nucleic acid and the array or both the sample and control genomic nucleic acid and the array or both the signals from the differential labels of the array to intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus cetaphe as compared with the relative copy numbers of sequences in the carray is determined using an intercalating dye or a detecrable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of of the genomic array is determined by determining the reference of anticleic acid are labelled with detectable moiety such that hybridization and antical antipolar array is determined by determining the reference and respective and antical and the reference.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 array or both the sample and control genomic nucleic acid and, the array with the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the campared with the relative copy numbers of sequences in the genomic carray is determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moisty such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic arrays. The genomic array comprises nucleic acid that is prepared from Bacterial Archificial Chromosome (BAC) clones. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                843 CCTGCCTCGGCCTCCC 858

```
CC encoded by the nucleic acid, an isolated antibody that specifically
CC recognises the delta opioid receptor variant, a vector comprising the
CC nucleic acid, a host cell transformed to contain the vector, producing
CC mucleic acid, a host cell transformed to contain the vector, producing
CC modulates the expression of the nucleic acid, diagnosing a genetic
CC predisposition to an eating or energy homeostasis disorder by detecting
CC the presence or absence of the variant nucleic acid in a patient sample,
CC an allele specific primer that detects a polymorphism in the gene
CC encoding a delta opioid receptor associated with an eating or energy
CC contain the variant nucleic acids. The variants are named Oppol-1 to
CC contain the variant nucleic acids. The variants are named Oppol-1 to
CC contain the variant opioid receptor gene is located on chromosome 1. The
CC diagnosing a genetic predisposition to an eating or energy homeostasis
CC diagnosing a genetic predisposition to an eating or energy homeostasis
CC disorder, such as anorexia nervosa. The allele specific primer is useful
CC associated with the disorder cited. The present sequence is a genotyping
CC pre primer for detection the present of a particular suc (sincle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid molecule encoding a delta opioid receptor variant associated with an eating or energy homeostasis disorder. Also included are a delta opioid receptor variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid molecule encoding a delta opioid receptor variant associated with an eating or energy homeostasis disorder, useful for diagnosing a genetic predisposition to such disorder, e.g. anorexia
Sequence 16 BP; 4 A;
                                               associated with the disorder cited. The pre
PCR primer for detecting the presence of a
nucleotide polymorphism) in a sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nervosa.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel isolated nucleic acid molecule comprising a variant gene associated with an eating disorder and selected from any of 119 polymorphisms with their corresponding genotyping in dataset, alleles and HGBASE identification, given in the specification. The novel nucleic acid molecule has polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, which is useful in diagnostic and prognostic assays for eating disorders, in particular anorexia nervosa and bulimia nervosa. This polymiclectide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecule having polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, useful in diagnostic and prognostic assays for eating disorders, such as anorexia and bulimia

associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, vbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's diseases atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with altergens that lead to
                                                                                        allergies. Type II hypersensitivities such as those present in allergies. Type II hypersensitivities such as those goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel nucleic acid containing a specific CC segment having at least one region that modulates expression of the VR1 CC (vanilloid receptor type 1) receptor, or a functional derivative, allele CC or fragment of this region, or a sequence that hybridises to it under CC standard conditions. The VR1 modulator is derived from one or more of CC positions 221931-223344 of GenBank AL670399, 31673-36359 of AL663116, or CC 44731-43231 or 36616-33151 of AF168787 and is involved in transmission of CC pain, particularly in primary sensory neurons. The invention also CC describes a vector that contains the VR1 modulator, host cells containing this vector (other than human germ or embryonal stem cells) and a method for modulator or the vector into a cell that contains the VR1 gene. The CC products of the invention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-stranded CC oligonuclectide fragment of it), e.g. by Western blotting or enzyme-CC linked immunosorbant assay, particularly for diagnosis of diseases CC associated with overexpression or underexpression of the transcription factor. The region that modulates VR1 receptor expression includes a CC binding site for a transcription factor, e.g. MZF1, NFkappaB, NFAT or CC GATA1. The nucleic acids of the invention, or vectors containing them, CC sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also neuralgia and myalgia, that are associated with activity of the VR1 creeptor. This sequence represents a fragment of human VR1 exon 1d DNA which is canable of hinding to a represents a transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 2171

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (i.e. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 11 primer pairs are shown in AAQ95841-82. The published size range of the D13S217 allele is 160-174 bp, and the degree of heterozygosity in the population is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The M
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Kit for automated genotyping contg. pairs of PCR primers - designed amplify polymorphic nucleotide repeat sequences, arranged in sets with a characteristic fluorescence label, useful e.g. in detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; aryl hydrocarbon nuclear transport;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18186 to AAA19086
CC AAA19155 to AAA19222 represent their corresponding target sequences;
CC AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme
CC sequences for integrin alpha 6 subunit, and AAA21852 to AAA21500 and
CC AAA21596 to AAA21688 represent their corresponding target sequences;
CC AAA21689 to AAA21688 represent their corresponding target sequences;
CC AAA21689 to AAA22475 and AAA23263 to AAA2342 represent ribozyme sequence
CC for integrin subunit beta 3, and AAA22476 to AAA22362, AAA23343 to
CC CAA23422 represent their corresponding target sequences. The ribozymes of
CC CAA23422 represent their corresponding target sequences. The ribozymes of
CC contegrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
CC contegrin subunit beta 3, integrin subunit alpha-6, or Tie-2. They are
CC especially used to treat cancer, diabetic retinopathy, age related
CC macular degeneration (ARMD), inflammation, and arthritis, as well as
CC engiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber
CC engiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 2173

The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl clave gene, an integrin subunit beta 3 cc hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 cc gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNY, and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA189187 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 and AAA19122 represent their corresponding target sequences; AAA19223 to AAA21681 and AAA21595 represent ribozyme sequences; AAA19223 to AAA21688 represent their corresponding target sequences; AAA21689 to AAA21688 represent their corresponding target sequences; AAA21689 to AAA22475 and AAA2363 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA2376 to AAA23262, AAA23341 to
                                           AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1999-591315/50

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17695 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19155 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA21861 and AAA21501 to AAA21555 represent ribozyme cC AAA12323 to AAA21868 represent their corresponding target sequences; CC AAA1889 to AAA22168 represent their corresponding target sequences; CC AAA21689 to AAA22165 and AAA2363 to AAA23427 represent ribozyme sequence for integrin subunit beta 3, and AAA2364 represent ribozymes of the invention are used for modulating target sequences. The ribozyme of the invention are used for modulating the synthesis, expression and/or CC AAA2369 to AAA22475 and AAA23263 to AAA2342 represent ribozymes of the invention are used for modulating the synthesis, expression and/or CC categorially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as concevabrated sequences, Sturge Weber CC syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, inhunit alpha-6, or riborin subunit alpha-6, or riborin subunit subunit beta-3 of ARMT, Tie-2, integrin subunit bet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

```
CC hydrocarbon nuclear transporter (ARMT) gene, an integrin submit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17622 represent ribozyme sequences for ARMT. CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18186 to AAA19086 cC AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme cC sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA22475 and AAA2363 to AAA21502 to AAA21500 and CC AAA21599 to AAA22475 and AAA2363 to AAA2342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23343 to CC AAA2342 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or CC stability of an mRNA encoding angiogenic factor, especially ARMT, CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as negotions of tuberous sclerosis, pot-wise stains, Sturge Weber candidation subdireme. Osler-Weber-Rendu syndrome.

AAA16775 to CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CC carresponding target sequences; AAA17681 to AAA17622 represent ribozyme sequences for Tae-2, and AAA19184 represent ribozyme sequences for Tie-2, and AAA19185 to AAA19122 represent their corresponding target sequences; CC aAA19123 to AAA20361 and AAA21501 to AAA21955 represent ribozyme cc sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and CC AAA21596 to AAA21488 represent their corresponding target sequences; CC AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA23476 to AAA22362, AAA23343 to CC CAAA21489 to AAA22475 and AAA22363 to AAA23422 represent their corresponding target sequences of the invention are used for modulating the synthesis, expression and/or CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are CC especially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as CC canjotfibroma of tuberous sclerosis, pot-wine stains, Sturge Weber condictions and diseases related to the levels of ARMT, Tie-2, integrin subunit beta-3.

CC cleaving activity, which specifically gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA17675 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT. CC and AAA17168 to AAA17560 and AAA17635 to AAA17635 to AAA17694 represent their corresponding target sequences; AAA1635 to AAA18385 and AAA19086 CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19086 to AAA19154 represent tribozyme sequences for Tie-2, and AAA19086 to AAA19154 represent tribozyme sequences for Tie-2, and AAA19086 to AAA19154 represent tribozyme sequences; AAA19154 represent tribozyme sequences; AAA19154 represent tribozyme sequences; CC and AAA19155 to AAA19222 represent their corresponding target sequences; CC AAA19233 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences; CC AAA21689 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA22475 and AAA23263 to AAA2342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23342 represent ribozymes of CC CAA231422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or CC stability of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related CC angiofibroma of tuberous sclercosis, pot-wine stains, Sturge Weber CC angiofibroma of tuberous sclercosis, pot-wine stains, Sturge Weber CC and other syndromes and diseases related to the levels of ARNT, Tie-2, CC integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; clear eyndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-OCT-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 54; Page 253; 305pp; English.

The ribozyme of CC AAA23422 represent their corresponding target sequences. The ribozyme of CC AAA23422 represent their corresponding target sequences. The ribozyme of CC AAA23422 represent their corresponding target sequences. The ribozyme of CC atability of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as well as correspondences, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, CC and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3

The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17188 to AAA17563 and AAA17625 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19155 to AAA12622 represent their corresponding target sequences; CC AAA19232 to AAA21963 and AAA1865 to AAA1968 to AAA1968 co AAA1968 represent their corresponding target sequences; CC AAA19232 to AAA21561 to AAA21561 to AAA21562 represent ribozyme sequences; CC AAA1868 to AAA2168 represent their corresponding target sequences; CC AAA21689 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA21675 and AAA23263 to AAA23242 represent ribozyme sequence CC AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence CC AAA21689 to AAA22475 and AAA23263 to AAA23343 to AAA23422 represent their corresponding target sequences. The ribozyme of the invention are used for modulating the synthesis, expression and/or cespecially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as corresponding target sequences. They are cespecially used to treat cancer, diabetic retinopathy, age related consevent sequences and disease related to the levels of ARNT, Tie-2, integrin submit bata-3 are integrin submit bata-3 are related to the levels of ARNT, Tie-2, integrin submit bata-6 are syndrome, and disease related to the levels of ARNT, Tie-2, integrin submit bata-6 are integrin submit bata-8.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiintlammatory; antiarthritic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; age related macular degeneration; inflammation; neovascular glaucoma;
                                                                                                                                                                                                                                                                                                                                                                                  cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17560 and AAA17623 to AAA17884 represent their corresponding target sequences; AAA17885 to AAA18385 and AAA19087 to AAA19184 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19123 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21808 represent their corresponding target sequences; to AAA21586 represent their corresponding target sequences; AAA21596 to AAA21688 represent their corresponding target sequences; AAA21596 to AAA21475 and AAA23263 to AAA23362 to AAA23343 to AAA21596 to AAA23343 and AAA23342 represent ribozyme sequence for integrin subunit, beta 3, and AAA2376 to AAA3362, AAA33343 to AAA23343 to AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss
                                                                                      AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 1999-591315/50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      27-MAR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 2181
                                                                                                                                                                                                                                                   The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 cg gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CAAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17560 and AAA17623 to AAA1844 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CAAA19154 represent ribozyme sequences for Tie-2, and AAA19386 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19232 to AAA20361 and AAA21591 to AAA21595 represent ribozyme sequences; C AAA19235 to AAA20361 and AAA21591 to AAA21595 to AAA21590 and C sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and C AAA21689 to AAA21689 to AAA21687 and AAA22363 to AAA23342 represent their corresponding target sequences; C AAA21689 to AAA22475 and AAA2363 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23343 to AAA23343 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiotibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.
                                   AAA23422 represent their corresponding target sequences. The ribozymes the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes, and diseases related to the levels of ARNT, Tie-2,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SO
CC The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene AAA16775 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 CC aAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 CC aAA19234 represent ribozyme sequences; CC AAA19232 to AAA20361 and AAA21501 to AAA2155 represent ribozymes (CC AAA19232 to AAA2168 and AAA21501 to AAA2155 represent ribozyme sequences; CC AAA21689 to AAA22463 and AAA23561 to AAA23742 represent ribozyme sequence for integrin subunit beta 3, and AAA23476 to AAA23362, AAA23343 to CC AAA21689 to AAA22475 and AAA23263 to AAA23362, AAA23343 to CC AAA21689 to AAA22475 and AAA23263 to AAA23362, AAA23343 to CC AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as correspondences and archarits, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 2182
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
